ProMED-mail is a program of the
International Society for Infectious Diseases

<http://www.isid.org>

Date: Mon 9 September 2013

Source: IRIN News report [edited]

<http://www.irinnews.org/Report/97472/Côte-d-Ivoire-deadly-ebola-hemorrhagic-fever-breaks-out-in-ivorycoast>

The deadly Ebola hemorrhagic fever has broken out in the eastern Ivory Coast town of Bondoukou about one month after the World Health Organization (WHO) declared the West African country free of the disease.

J. S., the WHO country representative told IRIN News by telephone on Friday [6 September 2013] that the outbreak was confirmed on Thursday [5 September 2013] following laboratory tests that turned out positive for the disease. "Yes, that is true; we have dispatched one team to make preliminary assessments and also set up an isolation unit," he said.

The epicenter of the outbreak is in Bondoukou in the Zanzan district, which is located about 400 km north of the capital Abidjan. F. K., the district health officer, was quoted by Newspaper on Thursday [5 September 2013] as saying that 2 people belonging to the same family had died of the disease over the weekend.

In July last year [2012], the Ebola outbreak in the mid-western Ugandan district of Kibaale left at least 20 people dead.

EXERCISE - EXERCISE - EXERCISE

Ebola victims present with symptoms like fever, vomiting, diarrhea, abdominal pain, headache, measles-like rash, red eyes, and sometimes with bleeding from body openings. The virus is believed to be transmitted to humans from monkeys and bats and may cause massive bleeding in victims. Mortality rates can be as high as 90 per cent.

communicated by:
ProMED-mail rapporteur M. M.

Côte d'Ivoire ebolavirus (CIEBOV)

Also referred to as *Tai Forest ebolavirus* and by the English place name, "Ivory Coast", it was first discovered among [chimpanzees](#) from the [Taï Forest](#) in [Côte d'Ivoire](#), Africa, in 1994. [Necropsies](#) showed blood within the heart to be brown; no obvious marks were seen on the organs; and one necropsy showed lungs filled with blood. Studies of tissues taken from the chimpanzees showed results similar to human cases during the 1976 Ebola outbreaks in Zaire and Sudan. As more dead chimpanzees were discovered, many tested positive for Ebola using molecular techniques. The source of the virus was believed to be the meat of infected [Western Red Colobus](#) monkeys, upon which the chimpanzees preyed. One of the scientists performing the necropsies on the infected chimpanzees contracted Ebola. She developed symptoms similar to those of [dengue fever](#) approximately a week after the necropsy, and was transported to Switzerland for treatment. She was discharged from the hospital after two weeks and had fully recovered six weeks after the infection.

MESSAGE:

Institute of Public Health Surveillance would like to inform about a confirmed case of Ebola haemorrhagic fever in an injecting drug user (IDU) in the city of Paris, which we are currently investigating in collaboration with L'Institut Pasteur and the local health authorities.

The 31 year-old male recently returned from a visit to the Ivory Coast on 3 September and presented at a hospital on 7 September with flu-like symptoms, headache, sore throat and fever, vomiting and diarrhea. Tests for malaria were negative and further tests for Lassa and Ebola were undertaken.

There has been a lot of interest in the Media in France regarding this case and the public are anxious and asking a lot of questions.

Institute of Public Health Surveillance would be interested to know whether other countries currently have any cases of Ebola or suspected Ebola, especially in injecting drug users.

Contact person at Institute of Public Health Surveillance is Dr P. M.

(email to Artemis.excon1@ecdc.europa.eu or telephone +46 x xxxx x807)

You should carry out the actions required of you by this inject. Please reply to Artemis.excon1@ecdc.europa.eu or request external organisational advice via Exercise Control.

Inject Title:	Update on VHF case in France

To: EI Duty Officer, ECDC

Please be advised that the High Security Infectious Disease Unit, Paris is treating one male patient (31y) with confirmed Ebola Viral Haemorrhagic Fever.

Early laboratory results show low counts of white blood cells, very low platelets and elevated liver enzymes.

ECDC and DG SANCO have been notified via EWRS and WHO via IHR.

Nursing staff at the hospital and attending paramedics have been informed of the diagnosis. Contact tracing has been instigated.

Exercise Direction:	Telephone Call from FRANCE to ECDC EI Duty Officer (Follow up with email to support ECDC mail)
Inject No:	4
Inject Title:	Background information on Initial Case and Additional Cases in France

Information from Institute of Public Health Surveillance, FRANCE

1. 31 yr old man with Ebola died this morning of multi-organ failure with both internal and external bleeding. Time of death was 09:15 and his death was reported on television station TF1.

The deceased returned from Ivory Coast on 3 September 2013 on an Air France flight to Paris CDG and was symptomatic for 3-4 days. He was admitted to Hospital on 7 September with high fever ($>38^{\circ}\text{C}$), vomiting and diarrhoea, and due to recent travel history was tested for malaria. Further tests were undertaken by the Pasteur Institute for Lassa and Ebola.

Ebola Haemorrhagic Fever was confirmed by Pasteur Institute on 9 September.

Patient was transferred to High Security Infectious Disease Unit.

France notified WHO under IHR and the European Commission via EWRS.

2. In addition to the above, please be advised of the notification of 2 additional suspected cases of *Ebola VHF*.

Two males, both drug users and with recent travel history to Ivory Coast. Both were on the same flight as initial case (AF703 Abidjan to Paris CDG) and have been suffering from fever and flu-like symptoms.

One (27yr male) lives in Paris and shares accommodation with initial case. As a precautionary measure he has been isolated and taken to the Service des Maladies Infectieuses et Tropical for further investigation.

EXERCISE - EXERCISE - EXERCISE

- One (29yr male) lives in Marseille and has been hospitalized. The doctor who attended him at home also confirms patient mentioned that he had eaten bushmeat while in Ivory Coast. The doctor said there was a quantity of what looked like bushmeat in his kitchen and it has been taken away for investigation.

Results on blood samples for VHF for the above two patients are awaited.

Analysis of bushmeat is ongoing and confirmatory results should be available later.

More information will be released when available.

Contact tracing is being undertaken.

You should carry out the actions required of you by this inject. Please reply to Artemis.excon1@ecdc.europa.eu or request external organisational advice via Exercise Control.

TOXIC ALGAE - ITALY

A ProMED-mail post
<<http://www.promedmail.org>>
ProMED-mail, a program of the
International Society for Infectious Diseases
<<http://www.isid.org>>

Date: 10 Sept 2013
From: Thomas Roesel <roesel@lycos.com>
Source: The Times, 10 Sept 2013
<<http://www.timesonline.co.uk/article/0,,3-1700730,00.html>>

Bathing [swimming] was banned along 15 kilometres of the Italian Riviera yesterday when more than a 200 holidaymakers were treated at various hospitals after bathing in the sea and spending time on the beaches around Grado, near Trieste. Doctors at Grado, where most of the victims were treated, said patients (adults and children) were suffering from symptoms such as rhinorrhoea, cough, fever, bronchoconstriction with mild breathing difficulties, wheezing, and, in a few cases, conjunctivitis and vomiting. Around 20 people required hospitalisation.

A 60 year old, who swims regularly on the beaches, said that she had first noticed something wrong last Friday, when she went for a swim and emerged feeling nauseous, to find her eyes puffed up.

Local environmental protection staff have analysed air and water samples around Grado for chemical contamination but have not found anything unusual. It is suspected that this may have been caused by a so-called algal bloom. In previous years, similar events were reported in other Italian regions, in Toscana (west coast of Italy), Puglia (southeast coast of Italy) and Sicily (in southern Italy), associated with a particular kind of unicellular alga, *Ostreopsis* spp although these were less widespread and intense. However this time the numbers of people affected and their symptoms seem more severe. The sea is also discoloured in places, with patches of yellow/brown water being seen close on to shore.

EXERCISE - EXERCISE - EXERCISE

Sea water samples are being collected every day from beaches in the area of Grado to look for the presence of a high density of algae and for any associated algal toxins. Results from the first samples collected are expected in the next few days.

Officials in the provinces of Gorizia and Trieste are recommending that people should not bathe in the Adriatic until the problem is better understood or the all-clear is given and to be aware of symptoms associated with the suspected algal bloom.

Grado beach has been closed by Public Health officials. Local businesses are complaining that this is an over reaction.

A local resident said: "No one expects to spend a nice family day at the beach and then be infected by some sort of germs in the water. It's disgusting. We need to act fast. The last thing we need for the economy right now is to scare tourists away with something like this."

Inject Title:	From DG SANCO to ECDC: Italy reports on unusual cases

Inject Text:

From DG SANCO

Italy is reporting a significant number (approx 200) of people seeking medical treatment for breathing difficulties, coughing, sore throats and in some cases conjunctivitis. The hospitals are unable to determine what the cause of the problem is but it seems these cases are linked to people having spent time on or near the beach around Grado near Trieste.

Has ECDC had any other similar cases reported?

Inject Title:	Reports from Slovenia (MS)

From Slovenia

Large yellow patches in the sea around Portoroz are raising concerns that some kind of chemical has been discharged into the water, but Public Health officials in Ljubljana believe this problem may be related to the occurrence of an unusual algal bloom in Italy.

Doctors are reporting increasing numbers of cases around Portoroz of people suffering from skin irritation, sore eyes and throat and wheezing. Some people have complained of dizziness and tingling sensations. So far, of seventeen severe cases, 5 have been hospitalised. One child (under 5yrs) is described as critical.

We have also heard from colleagues in Porec (Croatia) that they are seeing similar problems and have 8 people in hospital with severe breathing difficulties, including 2 children.

All these people have spent time recently at the beach. Some of them had a rash after swimming in the sea. Authorities in Porec are “monitoring the situation” but have not yet decided whether to close the beaches or recommend no bathing.

You should carry out the actions required of you by this inject. Please reply to Artemis.excon1@ecdc.europa.eu or request external organisational advice via Exercise Control.

Inject Title:	MS (Slovenia) request for assistance

Inject Text:

Local authorities in Slovenia are concerned that shellfish farms, farming mainly mussels (*Mytilus galloprovincialis*), along the Adriatic between Portoroz and the Croatian border and beyond may be contaminated with whatever the yellow-brown substance is in the sea, a chemical or a toxin. This area exports shellfish internationally.

There have been some people seeking medical assistance for dizziness, vomiting and diarrhoea. A 5yr old child remains critical in hospital after spending time at the beach.

Media reports on the situation have raised considerable anxiety in Slovenia and the public health authorities are requesting expert assistance from the ECDC Communications team to help develop public messaging.

Also as they have no capacity to deal with an event of this nature Slovenia are requesting technical assistance from ECDC and request that a RRA is carried out to assess any risk of transmission of disease.

EXERCISE - EXERCISE - EXERCISE

Scenario Date and Time:	10 September 2013 at 15:30 / Scenario Date: 1st October 2013
Exercise Direction:	
Inject No:	17
Inject Title:	Time Jump & Update on Ebola outbreak and algal bloom RECOVERY PHASE

It is now 1st October 2013

1. Update on Ebola:

There are no new cases of Ebola reported in **France** and **Belgium**. Patients who were hospitalised in France and Belgium are now all recovering. The paramedic who was admitted to hospital with flu-like symptoms has made a full recovery and has been discharged from hospital.

Samples taken from the bushmeat confiscated from the apartment belonging to the male case hospitalised in Marseille have been analysed and confirmed as chimpanzee meat. No evidence of the Ebola virus was found.

2. Update on Algal Bloom:

Following an intense storm and the prolonged bora wind blowing from the north for the past five days, the algal bloom in the Adriatic has now dispersed. The beaches at Grado, **Italy** and around Portoroz, **Slovenia** have reopened. All patients in hospital have been discharged.

Laboratory results reveal that the harmful algal bloom was caused by a novel species of the dinoflagellate *Gymnodium* related to *Gymnodium breve*. Associated high levels of brevetoxin were also detected in the water but have now dropped to below detectable limits. Water and tissue samples analysed from the shellfish farms further down the coast have all proved negative for brevetoxin.

No further assistance is required from ECDC.

The Director has decided to downgrade the PHE Level and deactivate the EOC.

Using the appropriate SOPs and checklists, you now have 30 minutes to consider within your functional groups the following:

- **Downgrading and de-activation procedures**

EXERCISE - EXERCISE - EXERCISE

- Recovery phase and return to normality
- Re-allocation of staff
- Archiving of PHE material
- Assessment of crisis response processes

Consider who you will liaise and communicate with during this phase.

Consider what steps/actions you need to take regarding these procedures and the impact on your teams.

Functional Groups: (in accordance with PHE Management structure)

PHE management team, advisors
PHE technical group
PHE EOC group
PHE Communications group
PHE Administrative support group

You should carry out the actions required of you by this inject. Please reply to Artemis.excon1@ecdc.europa.eu or request external organisational advice via Exercise Control.

With regard to the PHE response please consider the following:

- 3 things that worked well
- 3 things that need improvement
- If you had to change one thing tomorrow, what would it be?

Refreshments will be available from 16:15

Please be seated in the **Boardroom** by 16:30.
